## 2. Introduction

The purpose of this test is to ensure that the design of tested chassis model can pass the thermal goal under specific configuration which is either inquired or the most critical one.

The components examined during this test are processors. The Room Ambient Temperature (T-Room) is specified to 35 degree C.

This report has defined test configuration, test setup, test procedures and all the relevant modifications. The test result would be valid only when the same circumstance has been applied.

The test was done by Chenbro Micom Co., Ltd. which is located at following address:

15Fl., No.150,Jian Yi Road, Chung Ho City, Taipei Hsien, Taiwan, R.O.C.

#### 4. Chassis Description (as Tested)

The RM41416 chassis is a Rackmount Server chassis that may ship with a ETASIS 600W power supply (optional) and four system fans. It has one exposed CD-ROM drive bay, one exposed slim CD-ROM drive bay, one exposed FDD drive bay and sixteen 3.5" Hotswap HDD drive bays.

The dimensions of this chassis are 26"D x 16.9"W x 6.9"H.

The chassis is manufactured by Chenbro Micom Co., Ltd. which is located at following address:

15Fl., No.150,Jian Yi Road, Chung Ho City, Taipei Hsien, Taiwan, R.O.C.

#### 5. Test Equipment Used

##### Thermal Chamber

The thermal chamber's picture is as following. This thermal chamber can control the Room Ambient Temperature (T-Room) at 35 degree C.

Fig. 1 – Thermal Chamber

##### Thermocouples

T-type, 36AWG thermocouples are attached to the components.

##### Data Acquisition System

The picture of Data Acquisition System is as following. The Data Acquisition System includes one Agilent 34970A, 48 channel temperature recorder and one PC for logging the measured temperature data. The communication interface between recorder and PC is RS-232C.

## 6. Support Software

The following software was used in this test.

- ♦ Maximum Power Program for Dempsey Processor
- ♦ I/O Meter. Rev.2003.05.10
- ♦ Agilent BenchLink Data Logger Rev.1.5.030305.
- ♦ Intel Frequency Display
- ♦ Windows XP + SP2 (English version)

## 7. Test Setup and Procedure

- ♦ Installation of the tested system
- ♦ Installation of the operating system with device drivers
- ♦ Installation of the stress software utilities
- ♦ Installation of the thermocouples
- ♦ Place the tested system into thermal chamber
- ♦ Power up the tested system
- ♦ Run the processor stress utility at 100% loading for both processors
- ♦ Run the utilities of the other devices such as HDD for simulating maximum loading
- ♦ Run the Data Logging Software to record the measurements
- ♦ Power on the process controller on the thermal chamber and control the room ambient at 35 degree C
- ♦ After the measured temperatures are settled, record the test duration and analyze the measurements.

## 8. Test Results

### Summary

With [Maximum Power Program for Dempsey Processor](#) running, the case temperature of processors did not exceed the specification for the [Dual 3.2GHz Intel Dempsey](#) processors under specified configuration. **Intel Frequency Display window did NOT have the instant warning message** (to present the over-heat status includes message color changed).

## 9. Conclusion

The [RM41416](#) chassis (as tested) does provide adequate cooling for the [Dual 3.2GHz Intel Dempsey](#) processors.

The maximum temperatures of processors, which were at 100% loading of processor stress utility under 35degree C room ambient. The most important part of the test result was that Intel Frequency Display window did NOT present the warning message.

The tested system does not necessarily represent the absolute worst-case that the system is subject to.

The system is not maximally loaded with add-in cards and their associated cables that could cause the internal temperatures to increase and reroute airflow.
